

The current debate about use and benefit of aged urine has been quite vociferous and persistent inspite of facts to the contrary. The basic fact remains that the Shivambu community is lost in the tragic conviction that:

1. Whatever appears to be useful in short term is gospel truth
2. No inclination to consider scientific facts as they present themselves
3. Shivambu is considered a panacea for all healing - irrespective of whether it occurs in every case or otherwise.
4. A tremendous amount of self cures have generated this belief that it can "cure all diseases".
5. Most practitioners have experienced great relief from suffering or cures to their maladies with help of Shivambu. So they feel – just as they were ignorant of these benefits, the same will apply to every case irrespective of study into the possibilities and the science behind Shivambu.
6. Modern medical practitioners – irrespective of pathy (allopaths, ayurvedic vaidyas, homeopaths) have been poor guides in clarifying and educating the public about facts of Shivambu. The general trend with the rare exception is to state emphatically "urine is awaste product and it should not be drunk. Would you eat feaces as well". Such is the general opinion amongst so called educated and literate people.
7. Sufferers have experienced to their dismay that current medical knowledge dos not answer all the required questions about Shivambu. So the opposite reaction ensues. Do not believe anything they say about Shivambu – "as we know better". This may or may not be correct. But this assumption holds more ground when severe and chronically suffering people find this magical benefit after Shivambu implementation – that changed their life forever. So why should they not believe their own personal experience which they have lived through.
8. Why should they listen or accept so called medical opinion when they are talking through their hat about Shivambu – its qualities, effects, etc. This becomes more evident when same medical practitioners do not have an explanation to their so called miraculous recovery from the same condition that the same medical practitioner was treating for years and sometimes offered no more solutions – but to await their time, and destiny of suffering.
9. Neither are the same medical practitioners curious about how this change may have come about using Shivambu. They just push it under the carpet.
10. I am now referring to renowned specialists across different genres – who have come from leading hospitals and practices and all they can offer is a miraculous cure – with not a thought to scientific exploration of –HOW COME THIS PATIENT RECOVERED FROM THEIR CHRONIC/SEVERE SUFFERING AND DEBILITIES TO RETURN TO A CLOSE TO PERFECT HEALTH NOW.
11. Such is the current state of health advisors (mainly allopaths) – so called experts who tout scientific validity and do not practice it with same values when other pathies provide relief.(I am now collectively speaking for complimentary therapies like acupressure, acupuncture, natural therapies, yog, diet, Suryanamaskar, fasting, alkaline diet, pH balancing, meditation, lifestyle change, Shivambu, etc.
12. The pharma lobby is very strong and has great vested interests. So they will do anything to preserve their domain & rightly so. But what about the scientifically educated and trusted medical profession (all pathies) which swore to provide quality of care, effective cures and better health to every one of their patients.

13. Have they forgotten their oath and forgotten that any healing has a cause and has to be studied to be then applied to maximum population for their betterment in health and relief of suffering.

Going through the above points about health as it is today, it's only natural that experimentation has reached its zenith and people will try anything to obtain relief from suffering. Most people who have tried and benefitted from Shivambu are at the forefront of experimentation. It takes a courageous person to dabble into Shivambu – irrespective of what your status in health was at that point in time. When the benefits ensue, we all tend to think of ourselves as GOD and believe everything we touch can turn to gold.

Under this cloud, we now have some people experimenting with aged urine. let us now look at the evidence and facts we know about urine – fresh and aged.

No.	Fresh Urine	Aged Urine
1	It is sterile	May not be sterile
2	It is generally acidic/slightly alkaline (7.0 pH)	Definitely starts to become alkaline as it ages. Can be as much as pH- 8 - 14 as suggested by some practitioners
3	Has been proven to be safe on ingestion	Unknown about infections. 3 year old is caustic to oral cavity and defoliates the mucous membrane
4	Has shown long term benefits with minimal side effects	Apparently short term results are astounding. No long term observations/results as yet
5	Side effects are generally linked to dosage and some individual health parameters	Known stinging , burning, mucosal lining defoliation, etc.
6	Cures diseases and reduces suffering over long term observations	Some recent claims of miraculous effects – not yet validated accurately with comparative testing.
7	Literature clearly states fresh to be ingested	Literature does not mention aged urine drinking at all.
8	Literature and experience (1000+ years) suggests aged/concentrated urine is very beneficial for external use only	So called modern literature is all based on individual opinions rather than collective evidence and long term study where the concerns lie.

Comparison of aged urine – its high alkaline pH & comparative data available for tobacco, smoking, drugs(opium, cannabis, LSD, crystal meth, heroin, etc), eating chillies and spicy foods, drinking very hot drinks, alcohol, have all shown in long term studies of accurate and statistically proven data about negative effects of these activities and their harmful effects on the human body. Let us take each one of these in turn and understand what we know as facts.

1. Tobacco – two categories – smoking, chewing and snuff use.

- Smoking is through mouth and affects the mouth, nasal passages and lungs directly.
- Chewing affects the oral cavity as the tobacco sits in mouth for a longer duration. Besides the juices are ingested and this may impact on the gut as well
- Snuff – its supposed to be inhaled through the nose. Local nasal mucosa absorbs most of it while some aspect may continue into the lungs and provide direct stimulation through absorption into the blood faster.

All tobacco products have been proven to be harmful after many years of study – 50+ years. They have studied the short term and long term effects of tobacco on the body. Cancers related to oral, gut, lungs, etc are well documented as long term effects. This has led to statutory warnings on all tobacco products as “cancer causing and advised to refrain from taking them”. The corporates have been banned from public advertisements and sponsorship of public events and a great effort is made to dissuade people from using tobacco as part of better health strategies. Some countries have actually banned different aspects of tobacco – cigarettes, snuff and tobacco chewing, as they feel its utter waste of human potential and grave risk to themselves. Besides the country suffers through loss of an hour and increase in health costs to community and nation.

This has been well documented by many medical studies in every tobacco user category - showing causal connection. With smokers studies have also shown the causal connection and completely stopping smoking can reverse a lot of the damage – but not sure – whether this applies to the risk factor of cancers.

2. Drugs:

The world today is in an exploratory & experimentation phase. With most of the population exposed to availability of drugs from simple to complex & mild to powerful drugs, the people are quite exposed to these realities. Besides a lot of parties consider using drugs as a status symbol and enjoy these luxuries. Drugs used occasionally – one can get away. But they are more likely to become habitual users and before they know it, they can become addicted. All drugs tend to have negative effects on the body – from mood swings, constipation, stomach upsets, excessive sleep, hyperactivity, staying awake, etc. these of course are going to have negative long term effects on the whole system – brain functioning, reality perception, moods and behaviour, liver and kidney damage, besides other organs too.

The damage caused can be short term use, short term effect and also slow long term damage. Most people on various drugs feel they are harmless, till they are hit for a six suddenly when they find addiction, dependency and chronic organ damage which most times is nearly impossible to reverse.

This has been well documented by many medical studies showing causal connection.

3. Chillies and spicy foods:

This is an area where most of the people enjoying spicy foods with chillies is generally in Asian countries and south American. In both these regions, there is a propensity and availability of extra hot chillies which are damaging to the body. Again, the person enjoying the spicy foods does not think it will do any harm at all. Partly because the harm occurs after many years of abuse of the body. Small complaints are generally overlooked and once they go past the point of no return – the person is in no capacity to consider avoiding spicy foods. They live to eat hot spicy foods even though they are suffering and know it's bad for them.

The common problems that start off are acidity, mouth and gut irritation, bleeding in stools, haemorrhoids, fissures, piles, cancer of gut which has been over stimulated consistently. Again this has been observed statistically to advise people to avoid spicy foods as they are known to cause severe health problems over the years.

This has been well documented by many medical studies showing causal connection.

4. Very hot drinks/food:

This is quite an interesting area. We fail to see the number of people who love to enjoy hot drinks like coffee, tea, etc and also food to be served steaming hot. They appear to enjoy it at that temperature.

But long term use of such habits tends to literally burn the mucous lining of the mouth and gut and lead to issues relating to reduced protection for the mouth and gut. Ulcers, cancers and other gut and mouth related issues ensue. Oral hygiene may also be compromised like gum disease, tooth decay, tooth damage, etc.

This has been well documents by many medical studies showing causal connection.

5. Alcohol:

This is the most common damaging agent today. The amount of alcohol consumed as part of our lifestyle is phenomenal. Alcohol damage can be direct due to hard drinks undiluted like vodka, whisky, rum etc. in addition all other alcohol in form of diluted hard drinks, beer, wine, liquers, champagne, etc are all harmful as the body cannot live with alcohol levels in blood. So the liver has to work harder and detoxify the system. Over time this gets over worked and leads to chronic damage causing liver failure, cirrhosis of liver, hepatitis, gut issues and may cause collateral damage to other organs as part of the body's attempt to protect the system at any cost. Eventually brains can be damaged leading to various types of psychosis and alcoholic brain damage.

This has been well documents by many medical studies showing causal connection.

Most of these products should be banned. But the benefits the govt obtains in terms of taxes from such products appear to look positive on the budgetary side on an yearly basis. But the cumulative cost of health, social breakdown, family breakups, hardship cases, bankruptcy, loss of human time in terms of work hours and sick time – collectively tell the true tale of actual financial loss to the community, nation, family and social fabric of society.

Aged urine:

What is aged urine?

Let us look at this in detail.

We have collected urine stored for a few hours to a few days/weeks/months and years. Some store in glass bottles in cool atmosphere, while others consider exposing it to sunlight during the day and expect benefits of sun to occur.

We also are aware that some people show signs of fungal growth when urine is collected and stored. This in itself can be harmful to ingest.

It is also expected that although urine when fresh is slightly acidic or neutral – on keeping as it ages – urine has a tendency to become alkaline. As the pH increases from 7 – 9 or 12 depending on age or urine, this high level alkalinity can be harmful to the body.

Personal experiences:

Let me share my personal experiences with you – I regularly use old aged urine stored in glass bottles without fungal growth for many years. I use 3 year old urine on my skin and scalp and find it very cleansing and effective to enhance my skin quality and my dandruff and hair quality. Hair becomes thick, silky smooth with no undue natural oils that generally generate oily hair. Some graying reduced with persistent use.

With such benefits, I felt that use of aged urine(3 year old) may be beneficial for gums and teeth as well. So I had a mouthful of aged urine and swilled it around the mouth for a few minutes. It felt cleansing with teeth feeling good. But after I spat out the urine, I noticed clear whitish mucous lining being released all over the mouth. The cheeks were losing it, lips were losing it and the mouth felt a bit poorer for losing protection. I noted all flavours -especially spicy flavours were enhanced and creating slight discomfort. After all the mucous lining was cleared by spitting and pulling it off, I noted the oral cavity felt a bit raw. It took me nearly 36-48 hours before my mucous lining returned in full and my mouth appeared normal again.

What did I learn from this experience?

1. Higher alkalinity and caustic nature of aged urine causes damage to mucous lining of mouth,
2. Higher alkalinity of aged urine can cause damage to delicate mucous lining within the gut.
3. The oral mucous lining is generally stronger than the rest of gut – as we expose our mouths to stronger tastes whether pH wise or spicy wise.(chilly, pepper, ginger, garlic, sour, sweet, pungent, hot, etc.)
4. The gut lining within the body is quite delicate and repair mechanisms may take longer as food contamination is longer in stomach. The oral cavity can be washed clean and kept clean for faster healing.
5. 3 year old aged urine and older being tested for external use on skin for different pathological conditions has been found to be quite effective in therapeutic use for healing. But the same caustic urine (higher alkalinity -higher pH), may be quite harmful to internal organs – especially the stomach and duodenum which are used to acidic environment. Suddenly exposing this to alkaline environment has never been studied in full to ascertain the impact of high pH urine ingestion in the short term and long term.
6. Alkalis in form of medication is generally used as a prescription for acidity/ulcers, etc to reduce the acidity of stomach. By ingesting aged alkaline Shivambu with high pH, we are likely to consistently disturb that balance and generate a possible disharmony which may present as other issues in the future.
7. Whether its poor appetite, poor digestion, improper digestion, inability to absorb specific nutrients from the food we eat, etc . are all issues that need thorough study before considering such options.
8. The possibility of change to our acidic gut may mean a complete disturbance and chaos within the digestive system which is the gateway to creating energy from food within the Human body.
9. Long term slow damage to mucous lining of stomach and duodenum would be similar in nature to the effects of:
 - a) Chillies and spicy food ingestion(acidic foods)
 - b) Abuse of pure alcohol (slightly alkaline)
 - c) Eating and drinking high temperature foods (hot in temperature)
 - d) Tobacco and cigarettes (acidic)
 - e) Drugs (highly acidic - 3.5 -5.8)

10. We are now well aware that slight change in pH, persistent use and cumulative effects cause disharmony to the human body. This damage has been shown to be quite severe in most of above people who habitually use such modalities or combinations of those.

So what do you think is likely to happen when we drink aged urine which may have pH ranging in higher levels – 10-14. Surely this has a caustic effect for sure.

For anyone disbelieving the effects all you need to do is go to any college laboratory and watch chemistry students play with chemicals. The moment, they start to handle higher or very low pH (highly alkaline and highly acidic), they start taking all precautions towards protection – whether its gloves for handling, using tongs, avoiding spills, wearing protective clothing to ensure noncontact with skin, etc.

You only need to ask chemistry students who play with chemicals routinely as to how their aprons have holes and their story of low/high pH items spilt or drops on their coats created an instant hole is quite common. I remember from my college days the care and precautions we took in handling acids and alkalies with great care and caution. So if the external skin which is tougher can react so violently and negatively to such liquids – what is the possibility of our internal gut which is much more delicate & can be affected immediately.

Just read stories of acid victims who have acid thrown at their bodies and also those who have ventured to drink it – to commit suicide. Talk to any doctor who has treated such suicidal & trauma cases & he can tell you the reality of such low/high pH impacts on the human body. Google talks about pH of, 8-10 as weak alkali/base, while pH of 11-14 is considered a strong alkali/base. The examples provided by google for strong acid is (HCL – hydrochloric acid) with pH of 0. The example for a strong base/alkali is (NaOH -sodium hydroxide) with a pH of 14.

We would not dare to touch these products and have contact with any part of the body as its outright dangerous to health and welfare. But other products with pH -9 - 14 like aged urine we consider safe to touch, handle and drink internally as well. Something is incorrect – either pH of aged urine does not go beyond pH 10 making it easier on the skin. But it will most likely be toxic internally due to delicate organs and mucosal lining which requires proper care and protection from the elements. Which is why we have a mouth with sensitivity to discern and provide security to our gut in terms of permitting foods which can be and are known to be dangerous for your body.

We normally do not eat bitter, foul tasting food even though it may be good for you. The only time we may accept it and ingest it is if it is medicine. But then it is prescribed for a specific malady and preventive health practice. We must review all these facts and try to bring some scientific validity to our actions if we need to further the science of Shivambu across the masses.

A classic case in point right in front of our eyes that has unfolded before us in past few years is the COVID virus and vaccine story. The vaccine was promoted more to make money than to save lives. The manufacturers knew this. They managed to fool the world for a couple of years. Recently data released and facts exposed have made them the laughing stock and the world is treating the vaccine affair as a big blot on medical developments and money making corporates.

I would not like this effect on Shivambu. We already have enough opposition. Using aged urine prematurely and finding long term consequences that no one wishes on their enemies will be the graveyard of Shivambu progress. I implore all Shivambu followers to think carefully and then consider this option. Do adequate research (individual & collective with about 1000 people all vouching for its short term & long term benefits with no ill effects , before we should accept the safe use of aged

urine) and then after surety of facts and no ill effects after many years of practise, we should be then able to **state emphatically that aged urine does have OR does not have potential** for drinking and internal use.

Good luck Shivambu followers and hope each one of you acts responsibly towards yourself, your family, community at large and the nation and world we belong to. Good luck and focused thinking about this topic of Shivambu use
